a. Agree b. Disagree <mark>c. Unsure</mark>

The Royal Society of Chemistry does not have a strong opinion on whether the proposed Scheme Administrator is the correct method of governance for the revised WEEE system. However, we welcome the proposal of a governance system that will lead to coherent oversight across all the nat ons. We also welcome the suggest on that the Scheme Administrator may have a number of funct ons to fulf I if this leads to evidence informed, coherent decision making.

In principle, the Royal Society of Chemistry welcomes the introduct on of other success measures in the revised WEEE system, part cularly those that may lead to evidence on the circularity of the system, crit cal mineral fows, or that may measure and monitor a breadth of environmental impacts, including greenhouse gas emissions and water usage. Mass-based targets as in the current system do not give an indicat on of, e.g., crit cal mineral fows, or any kind of environmental weight ng to the type and compo

longer an item is stored for before entering the circular economy, the more likely it is that it will not be following as t ght a loop and therefore its potent al value will not have been opt mised.

At present, there are some examples of materials recovered from WEEE being used as secondary raw material, e.g. by the Royal Mint. However, increasing the usage of secondary raw materials so this is done at scale will likely require incent visat on or regulat on by Government. Alongside this, facilitat ng cross-sector collaborat on to enable the circularity of materials, components and products at industry level will be important in helping to close loops and establishing the usage of secondary raw materials. This is likely to require addit onal data to be gathered to understand the industrial reliance on various materials, including crit cal minerals.

In a survey carried out by the Royal Society of Chemistry, the majority of respondents said they would be more likely to buy a piece of technology from a rival to their preferred brand if they knew it was sustainably produced (1). The majority also agreed that it is currently dif cult to f nd out if a device has been produced sustainably before purchasing. Therefore, product labelling that gives consumers bet er visibility of the sustainability of a product (including eco-design criteria) is likely to be a helpful part of the proposed eco-modulat on criteria, and in principle is something the Royal Society of Chemistry is support ve of, depending on the quality, reliability, and implementat on of this labelling.
